

Core skills in hand surgery: cadaver workshop

Hull York Medical School

13-15 September 2010

**Loxley Building, Hull York Medical School
University of Hull campus**

Improve your surgical skills in a safe environment,
with access to 'true to life' cadaveric specimens.

This first annual cadaver workshop focuses on providing the newly specialising surgeon with a refresher on related anatomy, and training on a series of procedures and techniques affecting soft tissues, tendon, bone, nerve and joint of the hand and upper limb which are common to many aspects of upper limb surgery.

Training will take place at Hull York Medical School's state-of-the-art anatomy facilities at the University of Hull campus. Under direction and supervision of expert tutors, trainees will hone their skills in basic hand surgical techniques, applying the pros and cons of each procedure and considering alternatives.

At Hull York Medical School a special "lite embalming" technique is used resulting in cadaveric tissues which are much more like real life. The course provides a big safety plus for surgeons and patients and a great advantage for our trainees, allowing a more true-to-life practice before performing procedures on a live patient.

Cost: £695 excluding VAT

Course Level: CT2, ST3 and ST4
